

I have just listened to samples of BPL interference to the Amateur Radio Bands (HF) at <http://www.cq-vhf.com/BPL.html> I cannot believe that anyone involved in communications and the regulation thereof would ever allow consideration of any mode that would guarantee the destruction of another mode. If you good people are intent on starting a war with the Hams of this country, you should know that unfortunately, there are plenty of Hams out here that will "fire back when fired upon". It isn't as if you have to be told this. You know that this will start an RF war. Please do not let this happen. This is not a threat. It is just real life in the real U.S.A.

Thanks for listening.

In the event of some terrorist disaster or massive natural disaster, you know, even as you read this note that, Amateur Radio will be the primary means of communications in the disaster site/sites and the BPL transmissions will continue impeding or stopping altogether any traffic flow between the various authorities and the general population. You must protect rf environment from more pollution from other modes of communication.
